### ctrlX - Drive

• Control in ProfiNet

- System configuration

Jordi Laboria (DCET/SLF4-ES)

2022/11/09| DCET / SLF4-ES | Jordi Laboria | Bosch Rexroth AG2022 All rights reserved, also regarding any disposal, explotacion, reproduction, editing, distribution, as well as in the event of applications for industrial property rights.

1

## Goals:

- ctrlX-Drive Configuration
- Description of a control FB (Indraworks)
- Control on Profinet with Tia Portal

## Configuration in ctrlX-Drive

2022/11/09| DCET / SLF4-ES | Jordi Laboria | Bosch Rexroth AG2022 All rights reserved, also regarding any disposal, explotacion, reproduction, editing, distribution, as well as in the event of applications for industrial property rights.

3

#### Communication selection:

#### Configuration Slot 0 (Consumer)

For the equipment to work, in jogging and positioning mode, we must configure the ctrlXDrive with this structure for the control part, data sent from the Superior PLC

In the system, the standard fieldbus words used previously have been eliminated and work has been changed with parameter S-0-0134, which does not include some of the data previously used by P-0-4077.

Parameter S-0-0346 has been included manually for managing the positioning operation mode, since S-0-0134, among other things, only allows us to activate the axis (AH, AF) and change of operation mode if we have more than one.

Caution with the "Current Conn.Length" since, due to system issues, it incorporates a few more bytes in the communication and can bring us some surprise, if we do not take it into account. After the incorporation of the data we have 26 Bytes that do not agree with those assigned in the offset that would be about 24

#### Slot 1 Configuration (Producer)

In the "Producer" part and to leave the size of communications the same as those used in the "Consumer", the 4 "empty" at the end are added.

Producer asynchron	DOUIS	Data con	figuration	
······		Offset	IDN	<b>+</b> ×
Status	producing	0	S-0-0135 : Drive status word	+ ×
Number	0	2	S-0-0051 : Position feedback value of encoder 1	+ ×
Producer cycle time	1000.000 us	6	S-0-0040 : Velocity feedback value of encoder 1	+ ×
		10	S-0-0390 : Diagnostic message number	+ ×
		14	S-0-0144 : Signal status word	* ×
		16	S-0-0000 : < empty >	+ ×
Max. connection length	56	18	S-0-0000 : < empty >	+ 🗙
Current conn. length	26	20	S-0-0000 : < empty >	+ ×
Connection class	-1	22	S-0-0000 : < empty >	+ ×
Process data				
100033 0010				

between those of the "Current Conn. Lengh" and those defined in the offset

Communication parameter lists:

If there is any problem when adding parameters with the option we can add them by accessing the parameter lists

#### Configuration Slot 0 (Consumer)

Parameters can be added in the "Configuration List" from parameter S-0-1050.0.6 and S-0-1050.1.6

#### Data mappings and communication structures (Consumer)

According to the offsets, defined from the positions within the frame, this would be this way

						E S			iu.	~
Offse	IDN	0	1	Ĩ	1		10	11		
0	S-0-0134 : Master control word	2	2			<b></b>	(12)	13	8	
2	S-0-0346 : Positioning control word	2		6			14	15		
4	S-0-0282 : Positioning command value	4	5	0	/		(16)	17	18	19
8	S-0-0259 : Positioning velocity	8	9	10	11		20	21	20	
12	S-0-0260 : Positioning acceleration	12	13	14	15		20	21	22	25
16	S-0-0359 : Positioning deceleration	16	17	18	19			25	26	27
20	S-0-0145 : Signal control word	20	21				28	29	30	31
22	S-0-0000 : < empty >	22	23		Ì		(32)	33		
		<u></u>	<u>II</u>	<u> </u>	II.		34	35		

The structures use the 4-byte system and in this way, the system itself always places the beginning of 4-byte structures (Dword) on multiples of four

-
4
8
12
16
20
24
28
32
36
40

Ο

However, when in the PLC part we put that the first of the areas start with the value 10, a ''shift'' of the areas is produced and in this case 2 more Bytes are ''added'' to the frame generated by the 26 of the "Current Conn. Length"

Current conn. length

2022/11/09| DCET / SLF4-ES | Jordi Laboria | Bosch Rexroth AG2022 All rights reserved, also regarding any disposal, explotacion, reproduction, editing, distribution, as well as in the event of applications for industrial property rights.

#### **Data Mappings and Communication Structures (Producer)**

Offset	IDN	0	1				10	11		
0	S-0-0135 : Drive status word	2	3	4	5	İ	(12)	13	14	15
2	S-0-0051 : Position feedback value of encoder 1	6	7	8	9		(16)	17	18	1
6	S-0-0040 : Velocity feedback value of encoder 1	10	11	12	13	ī	20	21	22	23
10	S-0-0390 : Diagnostic message number	14	15			1	24	25		
14	S-0-0144 : Signal status word	16	17			-	26	23		<u> </u>
16	S-0-0000 : < empty >	10	10			i	20	27		<u> </u>
18	S-0-0000 : < empty >	20	21			i l	20	23		<u> </u>
20	S-0-0000 : < empty >	20	21			ł	30	31		
22	Storouou Cempty 2		23				24	25		<u> </u>

#### Total: 26 Bytes

The structures use the 4-byte system and in this way, the system itself always places the beginning of 4-byte structures (Dword) on multiples of four

In this case, as in the "Consumer" section, if we start with area 10 we will see that the elements fit perfectly, although two more bytes are used that generate the 26 of the "Current Conn. Length"

Current co

onn. length	26

2022/11/09| DCET / SLF4-ES | Jordi Laboria | Bosch Rexroth AG2022 All rights reserved, also regarding any disposal, explotacion, reproduction, editing, distribution, as well as in the event of applications for industrial property rights.

The modifications in the communication must be "validated" by activating "Pre-OP" and then activating "OP". This allows the frame to be updated, both for the subsequent scanning of the equipment from the Master PLC and if we have changed any data manually.

A Bosch Company

#### **Parameters**

#### S-0-0134 Drive Control Word

Bit	Designation/function
10-8	Command operation mode 000: Primary operation mode 001: Secondary operation mode 1, etc. 111: Secondary operation mode 7
13	Drive Halt, 1-0 change: Deceleration of drive while maintaining maximum acceleration ( $S-0-0138$ ) (only possible if bits 14 and 15 = 1)
14	Drive enable 1-0 change: Torque disable without delay (independent of bit 15 or 13)
15	Drive ON 1-0 change: Best possible deceleration (only possible if bit 14 = 1)

#### S-0-0135 Drive Status Word

Bit	Designation/function
3	Status of command value processing 0: Drive ignores command value input 1: Drive follows command value input
4	Status Drive Halt         0: Not active, bit 13 in "S-0-0134" is 1         1: Active, bit 13 in "S-0-0134" was set to 0, actual velocity within "S-0-0124, Standstill window"
5	Position feedback value status ( <u>S-0-0403</u> )
7	Hardware enable (emergency stop) 0: Not active (bits 15 and 14 of " <u>S-0-0134</u> " are ignored, emergency stop is active) 1: Active
10-8	Actual operation mode 000: Primary operation mode active 001: Secondary operation mode 1 active 010: Secondary operation mode 2, etc.
12	Class 2 diagnostics warning (cf. S 0-0012) The bit is set if a class 2 diagnostics warning is present.
13	Class 1 diagnostics drive error (cf. <u>S-0-0011</u> ) The bit is set if a class 1 diagnostics error is present (drive lock-out).
15/14	Ready for operation (P-0-0116, bit 15/14) 00: Not ready for power on (e.g., P2) 01: Ready for power on (bb) 10: Control section and power section ready for op. (Ab) 11: In operation, with torque (e.g. AF)

#### S-0-0346 Positioning control word

Bit	Designation/function
0	Application of positioning command value Applied by toggling
2/1	Activation of positioning 00: Positioning active, started by toggling of bit 0 Positioning aborted by: 01: Infinite travel in positive direction (jog+) 10: Infinite travel in negative direction (jog-) 11: Stopping the axis (positioning stop)
3	Type of positioning command value         0: Absolute         1: Relative (depending on bit 4)
4	Dedicated point for positioning command values 0: Last effective target position ( <u>S-0-0430</u> ) 1: Active position feedback value ( <u>S-0-0386</u> )
5	Immediate block change 0: Drive moves to current target position, before positioning at new target position 1: Immediate block change, i.e., drive immediately moves to new target position
7/6	Behavior for sequential block (bit 5 = 0) 00: Halt at target position of start block 01: Overrunning target position of start block (mode 1) 10: Overrunning target position of start block (mode 2)

#### IP assignment for the axis of type ctrlDrive XMS

I Device view		
	Ethernet addresses	
axis1 [ctrlX DRIVE XMS] General IO tags Sys	Interface networked with Subnet: PN/IE_1 Add new subnet	
General     Catalog information     PROFINET interface [X1]     General     Ethernet addresses     Advanced options     Identification & Maintenance     Shared Device	IP protocol  Set IP address in the project IP address: 192.168.0.2 Subnet mask: 255.255.255.0  Synchronize router settings with IO controller Use router Router address: 0.0.0.0 IP address is set directly at the device	
	PROFINET         Image: PROFINET device name:         Generate PROFINET device name automatically         PROFINET device name:         axis1         Device number:         1	

The assignment of the IP number in the ctrlXDrive is done automatically from the Tia Portal itself

#### FB module for the control and status of ctrlXDrive in "Drive-Controller Positioning" mode

The first version of the control FB is in the generated library

ctrlXDriveProfinetV00.zal15
